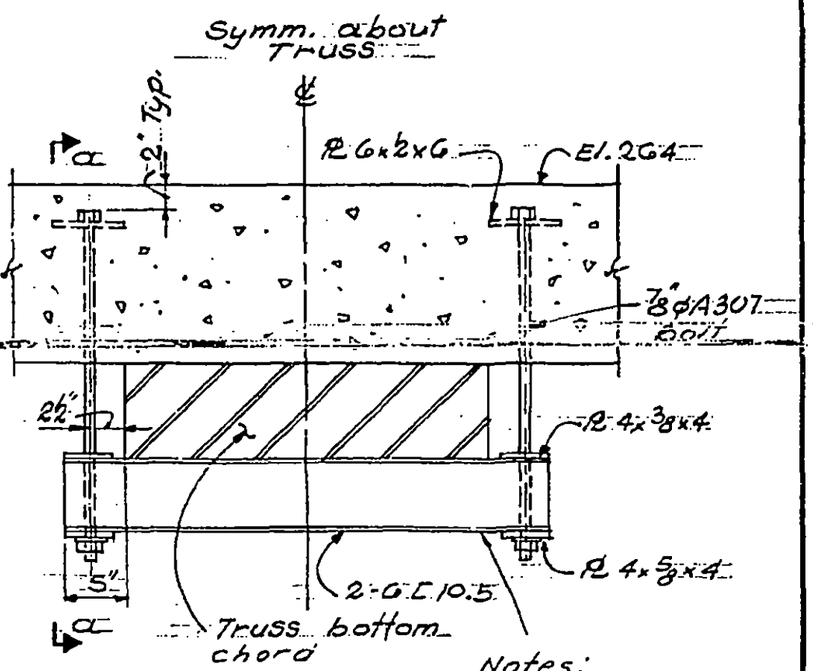
Typical detail for shop splice of single plate chord members

NOTE:

Tie bar material shall conform to the following:

1. To be made to coarse grain practice.
2. To be silicon killed.
3. To be forging quality.
4. To be ordered to vacuum degassed practice with extra top discard.
5. To be 100% ultrasonically inspected in specified areas in accordance with ASTM A435-65.
6. In the locations shown in the drawings, steel plate shall be free of gross internal discontinuities exceeding
   (a) 3 square inches measured as the projected area on the surface of the plate, or 3 inches in maximum dimension measured parallel to the plane of the plate, or both.
   (b) 1/32 inch when measured in the direction of the thickness of the plate.
   (c) The sum of the maximum dimensions of each discontinuity intersected by any plane perpendicular to the longitudinal axis of the plate shall not exceed 4 inches.
   (d) At surfaces on the plate where the plate is joined to the flanges of diagonal members, the plate shall be free of gross internal discontinuities exceeding 1 sq. inch in area within widths of 10 inches centered on the flanges of the diagonals and within a depth of 3 inches from the surface of the plate.

Detail A



Detail B

Notes:

1. Intermediate supports spaced at 10'-0" max.
2. All bolts to be field tightened after completion of prestress work for slab at El. 264. Provide temp. sup'ts. in place of C before bolts are tightened.

REVISIONS

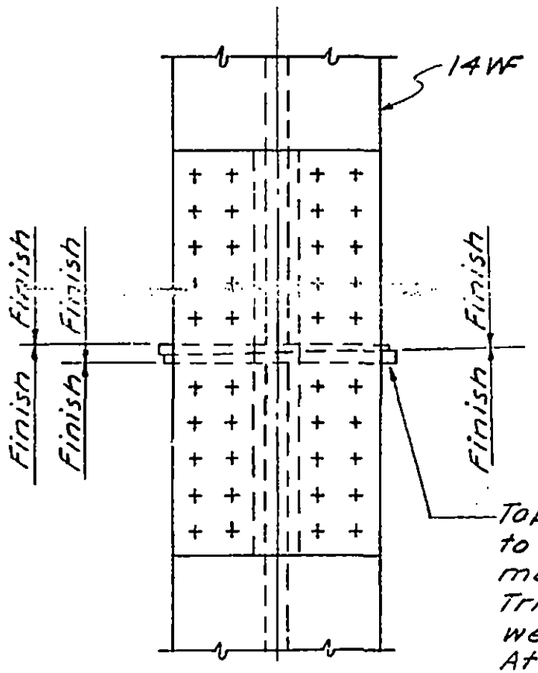
NOTE 1

Trusses shall be shop assembled.
All joints provided with shim plates depend upon contact bearing, and shall bear evenly with respect to the centroid on the contact area. The contact area consists of the two flange areas of the members.
When assembled in the shop, at least 75 per cent of the entire contact area shall be in full bearing and the separation of any remaining portion shall not exceed 0.01 inch.
When re-assembled in the field, at least 65 per cent of the entire contact area shall be in full bearing and the separation of any remaining portion shall not exceed 0.02 inch.
Where the joining of the members in the field does not meet these tolerances, the erection contractor shall provide and install tapered shim plates to achieve full bearing as indicated on Detail A (this sheet).



Tapered shim plates to be cut from field measurements. Trim flush and tack weld in place. At contractor's option a single shim plate cut to fit the field measured profile may be provided.
